

ABALONE SUSTAINABILITY

Abalone are gastropod mollusks. At Camanchaca we farm the species known as red or Californian abalone *Haliotis Rufescens* which comes from North America. Abalone are separate sex organisms with external fertilization. They feed on natural microalgae and macroalgae. They are farmed in a controlled manner in on-land facilities with tank systems. As a result, their production does not impact the environment. Reproduction and seed generation processes are performed under controlled conditions at Camanchaca's laboratory.
