

MUSSEL SUSTAINABILITY

Our farming and production processes are conducted in an environmentally responsible manner with respect for both the communities where we operate and future generations. Mussels are bivalve mollusks that feed by filtering sea water and live attached to a substrate. At our farming sites, mussels are attached to nets hanging from a floating, suspended system without affecting wild species on the seabed or natural banks of mussels.

Our operations provide jobs for 500 people (around 40% are women), making it a very important source of employment in the area. Our facilities and processes have earned "Friend of the Sea" certification.
